# Metricon Interconnect

Precision connectors for electric vehicles and industrial automation

Seed round, July 2026

Coimbatore, Tamil Nadu

# The problem

- An Indian EV maker designs in India and then buys its connectors from China.
- Lead times run 10 to 14 weeks and a design change means starting again.
- The few Indian suppliers are either too small to qualify or too slow to iterate.
- A connector is two rupees of copper and the reason a line stops.

# What we do

- We design, tool and manufacture connectors in Coimbatore, close to the customer.
- 41 part numbers approved across nine customers, from 18 a year ago.
- 22 to 31 percent below landed Chinese cost, at four week lead times.
- 184 parts per million defect rate against a 500 limit from our automotive customers.

# Why now

- EV two wheeler volume in India has made connector demand large enough to be worth serving.
- Customers actively want a second source that is not Chinese.
- Production linked incentives have moved battery and drivetrain assembly into Tamil Nadu.
- Coimbatore already has the tool room ecosystem. It did not have the connector design.

# Traction

- Rs 6.40 crore revenue in FY26, Rs 9.80 crore annualised in July 2026.
- EV is 58 percent of revenue, from 21 percent five quarters ago.
- Nine customers, none more than 33 percent of revenue.
- Near EBITDA breakeven at the current run rate.

# Why qualification is the moat

- An automotive connector takes 9 to 14 months to qualify into a platform.
- Once it is in, it stays for the life of that platform, usually four to six years.
- That makes growth slow to start and very hard for a competitor to reverse.
- 41 approved part numbers is 41 doors nobody else has to walk through again.

# Unit economics

- Rs 41,200 per thousand units, Rs 9,100 gross contribution.
- Copper is 61 percent of material cost and moves straight through to us.
- Scrap and rework fell from Rs 3,400 to Rs 1,100 per thousand as tooling matured.
- Bringing moulding and stamping in house took Rs 4,900 out of cost per thousand.

# The honest risk

- Plating is outsourced to a single vendor in Coimbatore.
- If that vendor stops, we stop, and we have not yet qualified a second.
- Copper repricing happens twice a year while the metal moves weekly.
- Both are fixable with this round and both are in the use of funds.

# Use of funds

- Rs 8.5 crore, expected to last 18 months.
- Rs 3.2 crore: in house plating line, removing the single point of failure.
- Rs 2.4 crore: two more moulding machines and tooling for 20 new part numbers.
- Rs 1.8 crore: working capital, because automotive pays in 60 to 90 days.
- Rs 1.1 crore: reserve.

# The team

- Ramesh Venkataraman, CEO. Sixteen years in connectors, plant head for a Japanese maker in India.
- Priya Sundaram, Engineering. Two granted design registrations on high current terminals.
- Naveen Kumar, Quality. Took two plants through IATF 16949.
- 64 full time across design, tool room and production.
