

Plant and Process Overview

Thrissur facility, lines and capacity

The plant

An 11,000 square foot facility at Koratty, Thrissur, commissioned in August 2024. Four process lines: cold pressing, blast freezing, low temperature drying, and cut and pack.

Capacity

Current throughput is roughly 42 tonnes of raw produce a month at 64 percent of a single shift. The second line in the use of funds and a second shift together take that to about 140 tonnes.

Cold chain

Two blast freezers and 60 tonnes of cold storage on site. Outbound to modern trade moves on contracted reefer vehicles with temperature logging attached to each delivery note.

Seasonality

Jackfruit runs March to July and tender coconut peaks in summer. Banana and coconut milk run year round and are deliberately weighted to cover the Q2 trough. Frozen inventory built in season carries the jackfruit line through to December.

Food safety

FSSAI manufacturing licence, HACCP implemented, and a third party audit in May 2026 scoring 88 of 100. Two observations, both on documentation, closed within 30 days.
