

Dashboard Overview

What the plant engineer sees

Home

One number at the top: rupees wasted this week, against last week. Under it, the three biggest contributors by machine, each with the shift and the time band.

Idle load

Machines drawing power while producing nothing. This is consistently the largest single recovery, averaging 3.1 of the 8.4 points of saving.

Peak demand

A live forecast of the month's maximum demand against the contracted limit, with an alert when the plant is on track to breach it. A breach in Tamil Nadu costs roughly twice the normal tariff on the excess.

Machine health

Current signature analysis flags bearing wear and phase imbalance. In FY26 this predicted 31 motor failures across the base, of which 27 were confirmed on inspection.

Weekly action list

Five items, ranked by rupees, each with the machine, the fix and the estimated recovery. This is the artefact the plant engineer actually uses, and it is emailed every Monday.
