

Fleet and Payload Specs

Airframes, payloads and maintenance

Fleet

Three airframes in service. Two multirotor platforms for close structural work with a 28 minute endurance, and one fixed wing VTOL for corridor mapping with a 74 minute endurance and a 42 km range.

Payloads

45 megapixel full frame visual, 640 by 512 radiometric thermal, and a survey grade RTK module giving 2 centimetre positional accuracy.

Maintenance

Every airframe is logged per sortie. Scheduled inspection at 50 flight hours, motor and propeller replacement at 200 hours, battery retirement at 180 cycles or 80 percent capacity, whichever comes first.

Redundancy risk

Three airframes is thin. The loss of the fixed wing VTOL would remove corridor mapping capability entirely until replacement, a lead time of nine weeks. Two additional airframes are the first line item in the use of funds.
