

Clinical One Pager

Clinical summary for medical directors

Intended use

Zylo is a triage and prioritisation aid for non contrast head CT and chest radiography. It reorders the radiologist worklist by suspected urgency and notifies on suspected critical findings. It does not produce a diagnosis and does not replace radiologist review.

Findings covered

- Head CT: intracranial haemorrhage, midline shift, hydrocephalus.
- Chest radiograph: pneumothorax, pleural effusion, consolidation, cardiomegaly.

Performance

Scans processed, July 2026	46,200
Hospitals live	11, across Kerala and Tamil Nadu
Contracted ARR	Rs 1.87 crore
Realised price per scan	Rs 34
Median time to flag a critical study	48 seconds
Sensitivity on internal validation set	94.1 percent
CDSCO Class B status	Filed 14 April 2026, under review
Monthly burn	Rs 19.8 lakh

Workflow

The study leaves the modality, reaches PACS, and is mirrored to Zylo in the same second. Inference completes in a median 14 seconds. A critical suspicion raises the study to the top of the worklist and sends a push notification with the key slice.

Safety

Every notification is advisory. The worklist remains fully accessible in arrival order. A radiologist can dismiss a flag in one tap, and every dismissal is logged and reviewed weekly as part of the post market surveillance plan.
