

Data Protection Policy

Patient data handling, version 3.1

Principle

Zylo processes imaging data as a data processor on behalf of the hospital, which remains the data fiduciary. Every deployment has a signed data processing agreement before the first study is transferred.

De identification

Patient identifiers are stripped at the hospital edge before transfer. Zylo receives a study identifier, the pixel data, and the technical DICOM tags required for calibration. The mapping back to the patient stays inside the hospital.

Storage and retention

Studies are held 90 days for audit and post market surveillance, then moved to encrypted cold storage for the period the hospital specifies, default 24 months, and then deleted.

Access control

Role based access with named accounts only. Engineering access to production imaging requires a ticket, a second approver, and is time boxed to four hours. All access is logged.

Breach handling

Any suspected breach is notified to the hospital within 24 hours of detection and to the relevant authority within the statutory window. No breach has occurred to date.
