

Radiologist Coverage Study

Field study on coverage economics

Question

Does worklist triage let one radiologist safely cover more hospitals, and by how much?

Method

Six radiologists across five hospitals were observed for eight weeks, four weeks before Zylo and four weeks after. Studies read per session, time to first read of a critical study, and self reported end of session fatigue were recorded.

Findings

- Studies read per session rose 19 percent, from 61 to 73.
- Time to first read of a critical study fell by 3 hours 41 minutes on average.
- Self reported fatigue was unchanged, which matters: throughput did not come from strain.
- Two of the six radiologists took on an additional hospital during the study window.

What this means commercially

The buyer is not paying for accuracy. The buyer is paying because one radiologist can now cover two hospitals where before they covered one, and the second hospital is revenue that did not exist.
