

Product and Technology

How it works

What the product finds

Every place an institution relies on cryptography that a quantum computer would eventually break: TLS termination, code signing, stored keys, HSM configurations and hard coded certificates in legacy applications.

Why discovery first

No Indian institution can currently answer where its vulnerable cryptography lives. Migration cannot be planned or priced until it can, so discovery is both the wedge and the honest first step.

The migration roadmap

Sequencing and orchestration of the replacement is on the roadmap and is where the recurring revenue is. It does not exist yet and is not sold.
