How it works

How measurement works

Satellite imagery estimates biomass change across the whole project area. A field app, which works offline, captures ground truth on a 4 percent sample of plots. The two are reconciled into a verification report the registry accepts.

Why smallholders are the hard case

Plots are a fraction of a hectare, so conventional survey costs more than the credits are worth. Satellite plus sampled ground truth is the only economics that closes.

The offline app

Field officers in Wayanad and Coorg work without signal for most of the day. Everything captures locally and syncs when a connection appears.
