

Product and Technology

How it works

The IP

Three analog front end blocks for industrial sensing: a low noise amplifier chain, a 24 bit sigma delta converter and a precision reference. All three are silicon validated on a 180 nanometre process.

Why licensed IP and not chips

Selling IP blocks avoids inventory, avoids a fab relationship at volume and puts the company inside the customer's design rather than beside it. It also means revenue arrives late, which is the trade being made deliberately.

Validation

Each block has a characterisation report against datasheet parameters across temperature. Both evaluation customers have reproduced the results on their own boards.
