

Product and Technology

How it works

What the software does

Schedules passes across rented antennas, decodes telemetry into readable parameters, and flags anomalies automatically instead of waiting for an operator to notice.

Why operators do not build it

They do, badly, and then maintain it forever. It is not their differentiator and it consumes the engineers who should be working on the spacecraft.

Current deployment

Flying against two live spacecraft with a third integration in progress through the ground station network partnership.
