

Data Pipeline and Provenance

How an item moves and what is recorded

The pipeline

A customer task arrives as a batch. It is routed to reviewers qualified in that sub domain, reviewed once, sampled for adjudication, then packaged and delivered with a manifest.

Reviewer selection

Every doctor is verified against the National Medical Commission register and every advocate against the Bar Council roll. Both then pass a paid qualification batch that is graded against a gold set before they see customer work.

Provenance

Every item carries the reviewer identifier, timestamp, time on task, the gold set score of that reviewer at the time, and whether it went to adjudication. Customers can trace any single label back to the person who made it.

Quality control

A hidden gold set is mixed into every batch at 4 percent. A reviewer whose gold score drops below threshold is paused and re qualified, not silently dropped.

Data handling

Source material stays in an Indian cloud region. Reviewers work in a browser workspace with no download and no copy. Personally identifying content is stripped before it reaches a reviewer.
