

Aether Semiconductors

Cohort 1 · Semiconductors · Kochi

What they do

Analog front end design for industrial sensing, sold as licensed IP blocks to Indian fabless design houses and instrument makers.

Where they are

Three IP blocks taped out on a 180 nanometre process and validated in silicon. Two paid evaluation licences signed with Indian instrument manufacturers. Pre revenue on royalties, which begin at customer volume.

The team

Two founders out of a global semiconductor company's Bengaluru design centre, with a combined nineteen years in analog design, plus a third on the verification side.

Why LIVE admitted them

India has design talent and almost no design product companies. The team had already taped out before applying, which removed the largest single risk in a semiconductor company at this stage.

What an investor should test

Royalty conversion from evaluation licence to volume, the length of the customer design cycle, and dependence on a single foundry relationship.
