

Verdant Climate

Cohort 1 · Climate technology · Kozhikode

What they do

Measurement, reporting and verification for smallholder agroforestry carbon projects, using satellite imagery plus a field app that works offline.

Where they are

Two projects under contract covering 4,100 hectares and 2,600 smallholders in Kerala and Karnataka. Annualised revenue of Rs 1.4 crore on verification fees.

The team

A remote sensing scientist, a carbon markets specialist who has taken two projects through Verra validation, and a field operations lead.

Why LIVE admitted them

Carbon MRV for smallholders is unsolved because the plots are too small to survey economically. Satellite plus offline field app is a credible answer, and the team has actually cleared a registry before.

What an investor should test

Registry acceptance of their methodology, buyer concentration in the voluntary carbon market, and whether pricing survives a market downturn.
