What they do

Ground segment software for small satellite operators: pass scheduling, telemetry decoding and automated anomaly detection across rented antennas.

Where they are

Pre revenue. Two paid pilots with Indian small satellite operators and an agreement with one ground station network. Software is flying against two live spacecraft.

The team

Founders from an Indian space startup's mission operations team, having run ground segment for four launches between them.

Why LIVE admitted them

Every new operator rebuilds the same ground software badly. It is a picks and shovels position in a sector where India is adding operators faster than it is adding ground capability.

What an investor should test

How many Indian operators are actually funded, whether the ground station networks build this themselves, and the length of the sales cycle into a public sector buyer.
